«The Rain Doesn't Come From Heaven»
If rain doesn't fall from the sky, then who flooded Valence?

by Alyssa Rangel

The difference between a globalized Spain and a globalized Israel

This article was first published in Culture Wars, monthly magazine, issue 44, no. 2, January 2025. It has been expanded in the version below.

At the end of September 2024, many Americans, myself included, were following the news about the flooding in western North Carolina. Like other Floridians, I knew that the way Hurricane Helene had traveled such a long distance was not natural. Hurricanes need the ocean to gain strength and maintain that strength. North Carolina residents clearly considered Alexander Mayorkas, of FEMA, like the villain of the story. Mayorkas is the U.S. Secretary of Homeland Security who prevented aid and supplies from reaching the devastated mountain population. In mid-October, Hurricane

Langues »

Milton struck Tampa, the initial victim of Hurricane Helene, and sped through central Florida, where my immediate and extended Mexican family resides. Having already observed Hurricane Helene's unusual behavior, I felt that Milton was also man-made and would be exceptionally dangerous. Tampa residents evacuated en masse. Not only was Hurricane Milton's straight path from Tampa to the Atlantic coast unusual, but it also caused unprecedented flooding and 150 tornadoes. According to PBS News, 3,4 million buildings lost power and 230 people were killed. Before the hurricane's arrival, 125 homes had already been destroyed,many of which were mobile homes in communities for elderly people»[1]When I saw the hurricane heading toward my family, I thought Bob Iger's Walt Disney World was about to expand into those remote areas where rednecks and Mexicans lived in mobile homes on acres of land. Many of these families live on their credit cards. They've been there for generations, as they were originally cattle ranchers and orange pickers who continued to run hobby farms. When the CIA was helping Walt Disney buy land in central Florida, it was a pig farmer who thwarted their plans and stood his ground. (See my article on Walt Disney in the magazine) Culture Wars (June 2022)[2]

I knew that by keeping a hurricane over central Florida, the government could damage homes, especially roofs, enough to make rebuilding impossible in the current economic climate. Evidence that mobile homes were a target in Florida was that FEMA had acres of them ready for distribution. FEMA employees had urged North Carolina residents to read the fine print (literally) because FEMA aid is a financial death sentence; if you don't repay the loan, all your possessions are confiscated. By this point, I had already purchased a plane ticket to Spain to work remotely for a month. As I was planning my trip, I learned that Valencia had experienced extreme weather and devastating flooding. Following local accounts of the event, it became clear to me that the events surrounding the flooding in Valencia were very similar to those that had occurred in western North Carolina. A vast land grab was underway, and climate geoengineering was at its core. I decided to go to Valencia to delve deeper into the issue of climate geoengineering. As I was taking off for Madrid, I looked back and saw that an "explosive cyclone was forming near Northern California."

Ultimately, the story that unfolded involved the usual suspects, but it also, providentially and surprisingly, involved Isabella, the Queen of Spain, whose canonization process has recently been revived! I did not expect my trip to Spain to lead me to discover the people, cities, and events closely linked to Queen Isabella of Castile, but the circumstantial juxtaposition of Queen Isabella's life and the unique world events we are currently experiencing has illuminated the source of the problem we are facing.

This article needs to be read urgently, because things are evolving very rapidly and we need to understand and discern the different ideologies and wars in which we are involved.

Isabella the Catholic and her projects

On December 13, 1474, the royal city of Segovia, with its unforgettable castle or alcázar, opened its doors to allow Princess Isabella I of Castile and her entourage to leave.

Her brother, King Henry IV, had died, and the throne of Castile was vacant. The beautiful princess, who was also rightly considered a pious and devout Catholic, proceeded in grand ceremony to the narthex of the Royal Church of St. Michael, where she was proclaimed queen, as she was the sole heir to the territories and the throne. The procession followed a sword held aloft, symbolizing the fullness of Isabella's power. The proclamation took place in the narthex and not further inside the church because it was a civil, not a religious, ceremony. Yet, this valiant and virtuous queen was the harmonious bridge between earthly and heavenly courts.

Historian Thomas Walsh explains that from the early 700s to the late 1600s, Christendom was engaged in a super-defensive crusade that had begun with the barbarian migrations whichhad turned off the light of Rome»[3], so that one can say that the pious "militarism" of Isabelle's "medieval ancestors" was imposed upon her[4]She was both a saint and a warrior, qualities that the Catholic Monarchs passed on to Europeans. At Isabella's birth, twenty years had passed since the martyrdom of Saint Joan of Arc. France and England had completed their Hundred Years' War, a war in which two rival dynasties had fought to the bitter end for the French throne. Until then, the French, English, and Spanish monarchies had been closely intertwined. Queen Isabella, for example, gave birth to Catherine, Queen of England, in Alcalá de Henares, Spain.

Isabella's coronation united the kingdoms of Aragon and Castile, as she was married to her cousin, King Ferdinand, whom she called "the king, my lord." Years later, she not only financed Christopher Columbus's voyage to America and the planning for the "ideal" city, complete with a hospital, church, laws, agriculture, and education system, but she also ensured that "her Indians" were treated as true subjects of Her Royal Highness. The queen went so far as to suspend all expeditions to the Americas for three years until the question of the Indians' legal personhood was resolved. She brought them to her and saw for herself that they were human beings. She then forbade them from being bought or sold, or treated as second-class citizens. Three days before dying in Medina del Campo, Queen Isabel, gravely ill, thought of us (Mexicans and other Hispanic American subjects), "her Indians," and wrote in an appendix to her last will and testament:

«That they suffer no harm, either to their person or to their property, but that on the contrary, they be treated well and receive justice, and if they have suffered any harm, that it be remedied and that they be provided with what they need…»

She asked bishops and clergymen to educate her new compatriots and encouraged racial mixing through marriage, which distinguished her undertaking from a true colonial project, to which Spain never subscribed. The expansion of the Spanish throne was so organic and just that the Incas considered Charles V the heir and continuation of their own dynasty.

A symbol of this union of races, religion, justice, and charity, the first bishop of my paternal family's hometown, Michoacán, Mexico, originally called Valladolid, was the beloved and well-known lawyer "Tata Vasco." Like the queen, Tata Vasco was born in Madrigal de las Altas Torres, a fortified town near Ávila and Valladolid, and was baptized in the parish of San Nicolás. He was elevated to the bishopric directly from the lay state in the 1530s, at the request of the local Mexican population and Bishop Zumárraga himself, to whom Our Lady of Guadalupe had recently appeared miraculously in a divine work of art clearly marked by the symbolism established in Spain around the Immaculate Conception. Many historians agree that Bishop "Tata" Vasco was historically the most effective in building the utopian Christian cities desired by the Queen, the Church, and Heaven. A hospital he founded with his own funds in Mexico was still operating until recently.

Five hundred and fifty years later, the once fortified cities of Segovia and Arevalo still celebrate the proclamation of Isabella's reign with theatrical reenactments, medieval music, local traditions, and lectures, because Spaniards still love this Catholic queen and because the life of Queen Isabella of Castile is so "Dramatic, so fascinating, that it doesn't need embellishment.According to historian William Thomas Walsh, Isabella was a crusader woman whochanged the course of civilization and the face of the world»[5]One of the most controversial acts of his reign is the implementation of the expulsion of the Jews. This fact alone should put an end to his cause for beatification (a preliminary step to canonization), but we will return to this point at the end of our story.

Langues »

Attending one of the aforementioned conferences in Segovia on December 7, 2024, I learned that, in addition to her dedication to the improvement of art, music, and public heritage, the Queen had restored 36 massive arches of the Roman aqueduct that the Muslims had destroyed during a siege of the city. To this day, the Segovia aqueduct remains the city's main tourist attraction, even though it boasts other architectural marvels, including the last Gothic cathedral. The Gothic style, emblematic of Christendom, was specifically chosen over the Renaissance styles that were flourishing at the time. Why had the Queen devoted her resources to the restoration of public spaces and monasteries? What motivates a queen to act, to love, and to defend her nation, her land, her subjects, her indigenous people, and God in a way unimaginable among today's politicians? What opposes the type of religious globalization that the Spanish accomplished through catechism, under the "Catholic kings" and through Catholic marriages?

And why did the queen expel from her territories the Jews who refused to practice Christian morality, but not the indigenous people, and before them, the Muslims? Let us focus on the current situation in Spain while recalling the words of B. Castiglione, who said that those who knew the queen confirmed that she reigned with the grace and authority of God:Affirm that the acknowledgment has been agreed to by a person who has a divinity to trust that if you do so, it is your intention to be granted by a mandamiento».[6]

Infrastructure bombings

Spain's water infrastructure is once again under threat due to the globalization goals of Europe's 2030 Agenda, which envision an immediate reduction in population and the subjugation of people and resources. As part of an orchestrated act of dismantling, from October 25th to 30th, 2024, the water infrastructure of Valencia, one of the country's most important cities, a port city, and arguably Spain's most significant agricultural center, was intentionally "pulverized." This resulted in immediate losses of life and livelihoods in Valencia and 70 of its municipalities due to severe flooding.[7]

However, Valencia was not the only city affected; severe flooding also occurred in many towns east and south of Madrid, as far away as Málaga. When the Spanish people called on their monarch for help, Philip VI admitted that he had no real power. The proof was that the king is legally authorized to mobilize the army in a state of emergency, which he did not do. The reason for the king's powerlessness was that, on December 6, 1978, Spain made a decision that proved fatal. The Spanish people chose democracy by approving a Constitution that usurped even the sovereignty of God. When the Spanish people criticized the army for not coming to their aid, Colonel Pedro Baños replied that the citizens should not involve the army in this matter, as it had obeyed the orders of their "democratically elected politicians", who, he emphasized, had been elected by these same outraged citizens"[8]These same politicians had supported Zelensky's war in Ukraine at the expense of their own citizens, notably by increasing the price of gasoline by two euros per liter.

With the help of her husband, Jose Manuel Sanz, Pilar Esquinas has tirelessly monitored the manipulation and control of freshwater sources in Spain for years, particularly through her organization, Aguaiuris. Esquinas is a skilled lawyer dedicated to defending legal cases, especially those related to water, and she keeps a close eye on the river basins of eastern Spain. According to her and official websites, Spain's rivers, canals, tunnels, and underground waterways are closely interconnected by a network of natural and artificial aqueducts. The amount of water flowing from one waterway to another in the Valencia region has been monitored since 1911 and controlled by the Confederación Hidrográfica del Júcar (Júcar Watershed Confederation). The water movement is precisely tracked and reported in real time thanks to meters that continuously record this flow. The Confederation's stated official objective for these meters was to detect sudden changes and prevent overflows.

Nine days after the catastrophic floods, Pilar Esquinas photographed and filmed the fact that a large and important reservoir located along the Turia RiverThe Benagéber Reservoir, also known as the Generalísimo Reservoir (because Franco had built many important dams and protected waterways in the 1950s), was still emptying. The video shows land emerging from the shallow waters and a boat that ran aground a few days earlier during the rapid draining of the reservoir. This is significant because Benagéber is the upstreammost of the other reservoirs, about a two-hour drive from Valencia.[9]Contrary to what is visible on the dam's website, the official website of the Confederación Hidrográfica del Júcar shows that the dam remained at approximately 44% of its capacity throughout the heavy rainfall of the last three days of October.[10]This could mean that it released water to maintain its level at 44%, but this is unlikely given the data below. It also wasn't necessary to maintain it at 44%, as the dam had been kept at over 60% of its capacity throughout the year until the drought period, when the water level dropped to less than 50% of its capacity.[11]The worst part, according to Esquinas, is that the protocol was not followed and the downstream towns were not warned that a large quantity of water was going to be released.

The next major dam downstream from Benagéber is Loriguilla. According to the Swiss Confederation's website, based on official data, the Loriguilla reservoir was only 52% full when it released 2,24 billion liters of water. Further downstream, the Buseo Reservoir, another large dam supposedly only 10% full, inexplicably stopped recording data from October 29th to November 13th.

Further south, along another river, and apparently unrelated to the dams already mentioned, the water level of the largest dam at Contreras, an industrial-sized dam on the Cabriel Riverwas only 54% full on October 31, according to official data from the Confederation[12]However, people on the scene filmed that it was only partially filled nine days after the floods. The dam should have been filled to at least 80% of its capacity to save lives, and according to the official website of the Confederación Hidrográfica del Júcar, the dam was generally maintained at 60% to 70% of its capacity. I myself saw this impressive dam 23 days after the flood, on my return trip from Valencia. The reservoir appeared relatively shallow.

On October 25, five days before the disaster, Pilar and her husband had driven to and from the Contreras Dam in torrential rain. It was raining so hard that they had to stop and take shelter at a gas station. That day, Pilar's husband, Jose Manuel Sanz, noticed that the local AEMET weather radar showed no clouds in the area, nor did it indicate that it was raining heavily. Also on that day, a farmer, El Payetero, noticed and reported that the weather radar was malfunctioning and warned that this could have serious consequences.[13]However, these radars were not the only ones out of service; those in Murcia, the Gulf of Cadiz and Morón de la Frontera, as well as those in Alicante, were also not working.[14]

After the floods, Pilar and her husband recorded damning videos showing that the water had been released "wildly," or "to the beast" because on December 6, not only was the dam still visibly not very full, as previous recordings showed, but going downstream of the dam, one could see that the water had reached incredible heights and had overflowed the riverbed, and yet, people had not been warned of the arrival of the water.

Along the Magro RiverThe Forata reservoir, the closest to Valencia and the area with the heaviest rainfall (according to AEMET, more than 750 liters per square meter fell on October 29th in Chiva), increased from 14% to 96% of its capacity, releasing 6,2 billion liters until the water level dropped back down to 79% of its capacity.[15]According to NASA, nearly 60 cm of rain fell on Chiva in 8 hours.[16]The authorities admitted to releasing the water but decided not to announce it to the public. The mayor of Algamesi stated publicly that neither he nor the public had been informed that a "tsunami" was

heading toward their city. The mayor said the waves that crashed in were disproportionate to the amount of rain that had fallen in those days. He acknowledged that it was the responsibility of the Confederación Hidrográfica del Júcar (Júcar Water Authority) to warn the city, as well as the federal government.[17]

On public television, Teresa Ribera, head of all the hydrological confederations and one of Spain's three deputy prime ministers, was held responsible for opening the gates of the Forata dam. Ribera was then on the verge of being elected by secret ballot to the post of Ursula von der Leyen's commissioner for the European Union. She took office on December 1st as first executive vice-president in charge of the "clean, fair and competitive transitionThis implies favoring certain companies that claim to be environmentally friendly. Thanks to her new appointment, Teresa Ribera has taken charge of EU competition policy,traditionally one of the most powerful fiefdoms of Brussels»[18]In an interview given to Guardian a month before the floods, shelamented" THE "denial"And"lateness"in the area of climate change, such as those "displayed by the CEO of the Spanish energy company Repsol».

Ultimately, the chain of command, which was necessarily aware of the release of water from local dams around Valencia, decided to remain silent from October 25th to 29th. AEMET, which works closely with NASA, didn't even report the heavy rainfall. This is remarkable because the Júcar River Basin Authority (Confederación Hidrográfica del Júcar) wasn't the only confederation affected, as catastrophic, tsunami-like floods occurred in other confederations within the hydraulic system, which also necessitated the release of water from dams and the disclosure of this information. The flooding continued as far south as Malaga, along the Benamargosa River, until mid-November.

Palantir

According to Pilar Esquinas, these destructive floods are occurring at the very moment when Congress and the Senate are approving the commercialization of water in Spain. Significant investments have been made by foreign companies, accompanied by land acquisitions involving companies associated with the University of California and Silicon Valley, who want to turn Valencia into a smart city—in other words, a police state, because in cashless and gasoline-free societies equipped with Wi-Fi, your credit card, your home, your refrigerator, and your vehicle can be deactivated at any time.

Members of the company involved in the land grab have financial ties with Jared Kushner, Trump's son-in-lawbecause Kushner is a part-owner of OpenGov, a company founded and run by Joe Lonsdale and other Jews[19]OpenGov is one of several Jewish-led Internet of Things (IoT) projects that aim to store and control crucial information about every individual, business (including banks), and government in their cloud software. The goal is to streamline everything and reduce the need for paid employees worldwide. Kushner admitted to investing in condominiums in Ukraine. He also suggested thatIsrael should evacuate civilians while it "cleanses" the Strip"of land called Gaza, because it is a valuable coastal area. Kushner argued that the Palestinians could be relocated to a small desert area (Gaza would have to be bulldozed) until reconstruction is complete."[20]What does Kushner think of the seaside land in Valencia? As we will see, tourism in Valencia and "climate change" are closely linked in the minds of these oligarchs.

Among the companies planning to rebuild Valencia, the one most often mentioned by Valencians is Palantir. Palantir is a software platform dedicated to big data analytics. It was founded by three Jewish men: Alex C. Karp, Joe Lonsdale (think cloud computing), and Stephen Cohen. Peter Thiel, who is not openly Jewish, was born in West Germany, is the founder of PayPal, and has ties to the CIA. According to TRTWorldPalantir was launched thanks to investments from the CIA through its "In-Q-Tel, a venture capital firm that invests in companies that enhance its reach, power, and espionage capabilities.»[21]The CIA itself has been led by figures like Robert Maxwell since its inception, a notorious practitioner of blackmail, theft, and murder.

Langues »

After Valencia's irrigation canals were destroyed and clogged with mud, President Pedro Sanchez refused to declare a state of emergency. Instead, he prevented rescue and search teams from reaching the affected towns. People were not allowed to search for or identify their dead, and the army did not arrive in time to immediately rebuild the infrastructure.We are at war", said Pilar Esquinas, "And we are lost as a nation and a civilization if we allow this.».[22]

What has been dismantled is the oldest legal institution in Europe, because the Valencia Water Distribution Court, the Tribunal de las Aguas, was perfected during the Reconquest (before the 16th century). It held paramount importance and priority, especially since the reign of King James I. This Tribunal is famous throughout Spain and has been declared a "Heritage of Humanity." This legal institution ensured the equitable distribution of water through contracts entered into voluntarily and freely. Final decisions regarding water distribution took into account the environment and history, because in Spain, nothing is done without considering pleasure, comfort, beauty, and culture. This ancient institution was literally bombed when three of its eight water distribution systems were blocked and destroyed from the inside by the water pressure. This was the only way to dismantle the venerable Tribunal, and it is unlikely to ever be restored.

And it's not just Valencia's water infrastructure that's under attack. Hundreds of dams and waterways, large and small, have been destroyed or intentionally neglected throughout Spain and in many other countries, especially after the Covid pandemic, under threat of fines and in violation of the law. According to Pedro Brufao, a water rights expert and judge, the destruction of "obsolete" infrastructure has been ongoing for three decades in order to comply with standards imposed by the United Nations.[23] A quick look at Pedro Brufao's international activities reveals his involvement with numerous Jewish networks, including that of Alexander Soros, one of George Soros's five children, and the American Jewish World Service, through International Rivers, to prevent the construction of dams, including local dams intended to harness and generate local energy. Brufao is personally and financially involved in the destruction of dams worldwide to allow rivers to flow freely everywhere. At the very least, International Rivers attempts to reduce the size of dam construction projects.[24]One of the purposes of dams is to slow the movement of water and heavy debris. When these barriers are removed, swollen rivers have their flow rush more easily towards cities and are much more destructive.

If Valencians fail to restore the infrastructure within three years, they will lose their water privileges. Just one month before the deadly floods, Palantir had Valencia and its Water Court in its sights. Global Omnium and Capitalidad Verde Europea 2024 presented a check for €9,873 to Francisco Almenar, president of the Water Court, on September 9, during Valencia's Cities Climate Week, specifically for the reduction of CO2 emissions through HortiGo2, a project directly overseen by Global Omnium.[25]The check transfer was facilitated by the Fundacion Aguas de Valencia. The check was delivered to the court at Global Omnium's headquarters in the presence of representatives from the Valencia City Council.[26], as well as the president of the Federación Nacional de Comunidades de Regantes and the representative of Valencia for tourism, innovation and investment (Turismo, Innovación e inversiones).[27]

Global Omnium specifically used HortiGO2 to pay the court to get rid of the CO2 emissions it attributed to "the tourist activities of the city of Valencia» (Valencia tourism)[28]In reality, the human carbon footprint is practically zero compared to the size of the Earth. Therefore, what they control and limit is agriculture. Olive groves, for example, have been replaced by fields of solar panels. But more precisely, human beings produce CO2 when they breathe. Reducing CO2 amounts to eliminating human beings and infrastructure. In retrospect, Global Omnium, Spain's largest public water utility, was handing a check to the court in anticipation of the coming floods. Global Omnium originated in Valencia because of the city's history with water distribution. Global Omnium expanded through GoAigua to control water services in the Middle East, Europe, Africa, Latin America, and North America. The utility company works with GoAigua and Xylem to "help unlock the hidden value of data"so that utility companies can calculate how many billions of gallons of water are not being billed"[29]without using employees. GoAigua and Xylem both consider themselves pioneering

technology companies seeking to "take advantage of the latest innovations in smart meteringLike Palantir, GoAigua is asoftware and analytics companywho hopes to break theinformation silos»This means that it wants to have your data and no longer deal with small companies. According to Stormwater Solutions, the center of all this water monitoring is Valencia, where GoAigua has a "real-time virtual copy"of its entire system in order to "to produce hypothetical scenarios in the past, present, and future, thereby improving our control and resilience to unprecedented levels»And despite all its advanced smart meter technology, Global Omnium was unable to warn its customers that their businesses and lives were about to be destroyed…

GoAigua processes and integrates the data to feed Xylem so that Global Omnium can have a "real-time view of the status of public service processes and infrastructure» in matters of drinking water, wastewater, irrigation, agriculture and water resources[30]GoAigua is supported by the IoT Big Data platform to control automated monitoring worldwide andcontrol the operationsThe question is, who synthesizes, analyzes, organizes, and controls the IoT (Internet of Things)? As mentioned earlier, Palantir's goal is to control the IoT. As Alexander C. Karp, Palantir's (Jewish) CEO, told his shareholders five days after the destruction of the Valencia municipalities:The world is in the midst of a US-led AI revolution that is reshaping industries and economies, and we are at the heart of this revolution. … We are in the software age, and we intend to conquer the entire market».[31]

Some evidence suggests that insurance companies were unwilling to renew or cover Spanish rail infrastructure after their policies expired on August 31. Oscar Puente, the Minister of Transport and Sustainable Mobility, should have acted quickly to convince an insurance company to accept even half of the previous coverage signed in 2020. This basic coverage was necessary to benefit from CCS (Consorcio de Compensación de Seguros) insurance in the event of extraordinary circumstances such as the Days (isolated high-altitude depressions). The fact that Mr. Puente only purchased half the coverage indicates that he signed out of extreme necessity and knowing that flooding was going to happen.[32]

Netflix in Valencia

Further evidence indicating that the Valencia floods were not only caused, but also targeted at the city center, was provided by Netflix, a company founded by Marc Randolph, a Jewish figure from New York, who remains its CEO. Marc Bernays Randolph is notable for being the nephew of Sigmund Freud and Edward Bernays, known as the "father of public relationsand propaganda. Bernays had worked for the largest American corporations and helped the CIA overthrow governments. Bernays specialized in thecrystallization of public opinion», Crowd psychology and the herd instinct. With such a background in psychology, it's likely that Marc Randolph had a specific goal in mind when he released Breathe exactly two months before the deadly floods in Valencia.

Netflix has launched the first season of a series titled Breathe on August 30, 2024. Breathe means "Breathe," but the English title of the series is Breathless ("Breathtaking"). The eighth episode, titled "DANA" in Portuguese, "Gota Fria" in Spanish, and "Cold Drop" in English, was filmed in Valencia and accurately depicted the flash floods that were going to occur in Valencia on Halloween Eve. Pablo Plaza, who played an extra in the series, warned that a nuclear war between Trump and Putin was in the "Atomic Monkey" episode of one of the upcoming seasons of Breathe and said he was going to buy a radiation suit. I wondered how often he planned to wear it.

Even though he was only an extra in the series, Pablo Plaza didn't immediately make the connection. Other Spaniards did. The "Gota Fria" episode predicted the exact amount of rain that ultimately fell on Valencia: 400 liters per square meter and more. Although there was what locals call a protective "bubble" around Valencia (which I'll explain later), many towns were flooded and destroyed, as were vehicles and family businesses. My guide in Valencia kept saying it

looked like a bomb had been dropped, and it certainly did. Garage doors were bent upwards, railway lines had been washed away, large bridges had collapsed as people were crossing them, and shops were now empty and ruined. The windows of many ground-floor residences were shattered, and masses of crushed vehicles were piled up in vacant lots we called vehicle graveyards. Twenty days later, when I arrived in Valencia, the underground transport system was still out of service, and search teams were still looking for bodies in a freshwater lake called the Albufera de Valencia, located 16 kilometers from Valencia's city center, near the sea. Above the Albufera, the small military team, the Dutch search team, and their dogs, the clear blue sky was streaked with layers of intricately patterned chemtrails.

The Netflix episode "Gota Fria" revolves around a hospital treating the injured from this climate disaster. The term "climate change" is used by a handsome and charming nurse who gently rubs his hand on the broad shoulders of his ignorant and intolerant nurse friend, who doesn't distinguish between heavy rain and the amount of water that should fall during this period. Gota Fria particular. The clever nurse says to the macho "Gallegos," "You've never seen anything like it." Gallegos, to be clear, refers to someone from Galicia, and Galicians tend to like the rain, but it was also a term used by Americans to refer to Spaniards in general (with a derogatory connotation, close to "dimwit"). Painful seconds tick by as the audience waits for the Galician to realize what's going on in his head.

After the floods in Valencia, Spaniards released a video comparing scenes from the Netflix episode with footage of the actual event. The video showed elderly people in a nursing home sitting calmly in their wheelchairs, intently watching the dirty water rise up around their knees. The question remains: what happened to them? The water eventually rose to between 2 and 2,5 meters. The footage, which closely resembled live broadcasts from France a few weeks earlier, showed vehicles being swept away at incredible speeds, with many passengers perched on the roofs of their cars, and headlights bouncing off the churning waves. In central France, rescuers carried out 2300 operations.some of which helped save lives", during the worst floods in 40 years[33]Italy, in the regions of Catania, Tuscany and Liguria, also experienced widespread flash floods and significant infrastructure damage in June 2024. Southern Germany, as well as southern Brazil and Texas, experienced devastating floods in May 2024. The EU stated that it would distribute €112 million in aid to Germany and €4 million to Italy.[34]

Unlike the United States, the Spanish economy is dominated by a wide variety of small businesses run by a handful of conscientious, charming, elegant, kind, intelligent, and sensible employees—all the qualities one hoped to find in the United States when one could still use the phrase, "May I speak to your manager?" when faced with a problem. Furthermore, Spanish employees are charitable and generous people. These small businesses are primarily located on the ground floors of the apartment buildings that form the center of each city. Another important fact is that Spanish cities are clean and paved with well-crafted stone and brick. According to a member of the Guardia Civil, Spanish cities are the safest in Europe. City centers are walkable and very lively in the evenings. Much of the parking is in underground garages. The floods occurred during a period of heavy traffic, as people were returning home from work or heading out for their evening activities. The rushing water did not come from a steady increase in rainfall, but from an influx of red mud and debris. Consequently, the engines of equipment, cars, and household appliances were destroyed, even though civilians managed to escape. Twenty days after the flood, towns like Paiporta were still teeming with dazed civilians, volunteers, soldiers, and workers carrying buckets of filth out of their businesses. Smaller towns like Algemesí lacked volunteers but were nonetheless busy cleaning their town centers. However, gleaming in the sunlight, next to a devastated Toyota parking lot and other destroyed dealerships, stood a McDonald's, its marble sidewalk not only shining brightly, but also having new paving being laid. The question is, who will rebuild in the current economic

climate? And: is there a link between the destruction of Valencia and the destruction of prime coastal real estate in Gaza? According to the Spanish news channel rtvp.esOn December 9, Israel recently destroyed more than 17 hospitals in Gaza to make way for new buildings on the seafront.[35]

As many know, the parallel coast of Valencia, on the other side of the Mediterranean, has a climate very similar to that of Jerusalem, Florida, and California. The dark green leaves of Valencia's orange and persimmon trees contrasted sharply with the mud-covered city. Valencia would be a perfect bridge between Israel and Hollywood. Hollywood took control of Walt Disney, and thus of Florida, through the Jewish magnates Michael Eisner (CEO), Bob Iger (CEO), and Harvey Weinstein (R-rated Hollywood). Journalist Nauzet Morgade pointed out that Silicon Valley has been investing heavily in Valencia for at least 10 years. Silicon Valley is also led by Jewish figures, such as the founders of Google and Facebook.

Ultimately, however, control of the Spanish coast up to Gibraltar, a British territory, is militarily necessary to control the Mediterranean Sea. Some have pointed out that Zelensky's war in Ukraine is a battle for control of important Black Sea ports.[36]As we speak, Israel is seizing control of the Lebanese coast through continuous bombardments. Furthermore, Valencia is home to enormous, iconic historical towers and forts, as well as the Holy Grail.

Pablo Corrado, a licensed and certified businessman and AI developer who experienced the event in Paiporta, near Valencia, and who played a key role in rescuing his wife and in-laws who lived on the first floor, explained that the military personnel who eventually arrived reported 2500 deaths, while "The media reported only 217 deaths after the first day, and that this number never increased thereafter.»[37]Military personnel told me directly that there had been many more deaths than had been reported. The same worker reported that even though it wasn't raining, a torrent of water began rushing into the city at 6:00 PM, and by 9:00 PM, it had reached its peak at about 2 meters. It's important to remember that Spaniards are on average shorter than Americans, especially women and the elderly, and their cars are generally lower and more compact. To witness this significant event firsthand, I returned to the city 20 days later and photographed the marks left by the rising water on the walls. The visible straight line of red clay, which was certainly left only after the waters had begun to recede, rose to at least two meters in Paiporta and other towns, but reached up to two and a half meters in streets at a lower level, and three times as high if you were in an underground garage. Pablo Corrado told me:

«My father-in-law was laying the bricks for the sidewalk in front of his house when the water started rushing in. Seeing the water, he started using it for his cement mix, and I told him, "What are you doing? Get inside." We were soon knee-deep in water, but outside, the water had risen halfway up the window. I told him we needed to move him and his wife to my floor in case the window broke. I also called my wife to tell her not to come back into town because of the flooding, but she didn't believe me. She tried to drive back, but she quickly found herself floating, unable to maneuver the vehicle, and had to get out. And that's how her car ended up».[38]

Corrado took out his phone and showed it to Ismael Gramage, my Valencian guide, businessman and scientist[39], who summarized the statistics of the water confederation, and to myself a photo of his wife's black vehicle, a kind of minivan. It was overturned.

"Gota Fria" most easily translates into English as "cold sweat." However, in anticipation of this new type of weather, the term was inexplicably changed to DANA. Gota Fria "Dana" was the term used by the Spanish to describe the phenomenon of intense rainfall that developed at sea and poured down onto the land. However, what is unusual in this

case is that the rain developed over land, which, as the Valencians will tell you, never happens. The inhabitants of more isolated areas, like those of Arévalo, explained to me that the term "Dana" was also imposed on them to refer to what has always been called "borrasca" (squall).

Maldito Clima

Maldito Clima (Damn climate) is a page on the site http://maldita.es (A "fact-checking" site) dedicated to combating misinformation and silencing any discussion of climate engineering technologies; this page responded to accusations that the floods were man-made by simply denying the claim. This website also stated that the conspiracy theory (based on negative primacy, the psychological tendency to favor negative experiences), which, according to the author(s), posits that elites plan natural disasters and major tragedies and then inform the public of impending events through fiction, was completely unfounded because "at no point" had it been established by any evidence whatsoever that DANA was man-made. I would respond that it is more likely that elites publicly tell each other stories of this kind in order to plan, boast, or warn one another. Maldito Clima then attacked the very terms used to describe the phenomenon, stating that "Gota Fria" and "DANA" are not very scientific or precise terms to describe meteorological events, before admitting that the media had replaced the term Gota Fria by DANA «although they do not refer to the same thing»[40]It's true, the Valencians showed obvious confusion at the sudden change in terminology and the sudden change in the behavior of the "Gota Fria." This manipulation of language was necessary to prevent the Spanish from comparing what they know about typical "Gota Fria" events with the exceptional event that occurred. The message was clear:You don't know. You can't know. "We're the ones who know" and "Stop talking."».

Maldito Clima The article then categorically states that there is no evidence of climate manipulation through the use of chemtrails, HAARP technology, or anything else originating "from Morocco." However, the article fails to explain how or why HAARP technology and Morocco were mentioned together in the same sentence, let alone why they had nothing to do with the event. The reason they were used in the same sentence is that the Valencians were indicating that HAARP technology existed in Morocco and was responsible for the devastating earthquakes that struck Morocco in 2023, killing 2950 people, injuring over 5000, and leaving 380,000 homeless. The magnitude 6,8 earthquake had struck a year earlier, on September 8, 2023.[41]

Morocco is important because it also controls the Mediterranean coast and is located near the Strait of Gibraltar, which belongs to Great Britain. After the earthquake in Morocco, the Spanish army arrived within hours to help with reconstruction. This sparked outrage a year later when the Spanish army was not sent to Valencia. The state had demanded it. Was the state therefore implicated in the cause of the earthquake? As we will see, one of the tactics of modern warfare is to provoke a disaster and then come to the aid of the victims.

After a short article intended to explain the "natural" disaster, the author assures his readers that Damn.es is dedicated to untangling the lies and misinformation surrounding DANA. It is necessary, the author(s) continue, to follow only official news sites and not to share misinformation. As on other web pages[42] specifically dedicated to disinformation, Damn.es advises the reader to send him any dubious information via WhatsApp (+34 644 222 93 19) in order to verify the lies or the bulls (rumors). The website's web pages end with the advice "Hazte maldito, Hazte maldita," which can be translated as "Adhere to Damn.es", or "Be smarter with us" or even "Damn Spain." In the United States, federal advertisements conveyed the same message for more than a month after the disasters in Valencia and North Carolina.

Aerosol injections into the stratosphere, also called chemtrails

Before examining the evidence gathered by the Valencians to demonstrate that this new meteorological phenomenon was orchestrated or caused by humans, we must first ask ourselves if climate modification is even real. Can it target specific locations, and why is it so mysterious? Why, for example, are chemtrails, which are commonplace and

widespread in America, Great Britain, Germany, France, Spain, and other countries, so mysterious? What about less-observed instruments, such as HAARP antennas or those fenced-off factories that Americans drive past, which release plumes of white cloud into the air 24 hours a day?

Kristen Meghan, a veteran and environmental specialist in the U.S. Air Force for nine years, explained in an interview with kla.tv on July 6, 2024, which his colleagues called climate engineering "geo-engineering"[43]Meghan worked at a bio-environmental engineering office that approved chemicals used in "stratospheric aerosol injections," which civilians call "chemtrails," but she had to investigate for herself the real purpose of the chemicals she was approving.

According to Kristen Meghan, "geoengineering" is not only a mystery to civilians, but the facts are hidden and concealed even from Air Force officials like herself. Meghan, whose job involved assessing the personal protective equipment needed to properly handle and transport hazardous chemicals, began to suspect the purpose of those same chemicals and wondered, "Why would we alter the climate by using dangerous materials in our atmosphere?" After delving deeper into the matter, Meghan had to backtrack. During the interview with kla.tvShe explained that there are several forms of weather modification, which she termed geoengineering. Meghan stated that she hadspecifically identified what concerns injection of aerosols into the stratospherewhich is now openly and publicly defended as useful in combating "climate change," even though its actual purpose is to cause climate change. When the interviewer asked her what types of chemicals were being injected into the atmosphere, Meghan listed metals sprayed in nanoparticle form, including aluminum, sulfates, barium, chromium,and now" she said, looking perplexed,silver iodideApparently, the chemical used in the chemtrails This was not the one Meghan had documented when she worked for the Office of Bio-Environmental Engineering, but why should we expect interested companies or the military to admit to spraying dangerous chemicals on civilians daily, resulting in the loss of lives, livelihoods, and crops? During the pandemic, for example, the Spanish government claimed on its official website that chemtrails released into the atmosphere were a type of Covid disinfectant for the public. As the Spanish say,pura bula» (nonsense).

Meghan argued that the quantity and form of these substances are not safe; these are the types of chemicals she was taught to remove from the environment as "toxic substances" that cannot be filtered out by wastewater treatment plants. She stated that the continuous overflights were causing neurological illnesses and respiratory problems. Meghan emphasized:These are not small quantities"And this ends up in food and soil." Meghan then referred to the severe flooding in California and recommended that interested parties also look into the US's HAARP technology, or High Frequency Active Auroral Research Program antennas, which were originally built in Gakona, Alaska, by the US Air Force and Navy to study the ionosphere and test the effects of heating or sending radio waves into that part of the atmosphere using ahigh power and high frequency transmitter»[44]The program was later transferred to the University of Alaska Fairbanks, but the HAARP website admits that there are still Air Force signs around the technology, as the 1158 acres (at least) still belong to the Air Force.[45]Today, HAARP in Alaska admits to collaborating with NASA radar systems engineers to study, among other things, the interior of asteroids using radio waves that are then picked up by the five continents.[46]Following the "explosive cyclone" that struck Northern California in November and the magnitude 7 earthquake on December 5, 2024, I ask: if the interior of asteroids and their weight distribution can be determined with the aim of altering their trajectory, why does HAARP deny that faults and tectonic plates are being studied with the aim of potentially altering their movements? HAARP's official website admits that there are two layers of the atmosphere thatproduce the Earth's climate", but then states that he would not consider intervening on the "troposphere nor stratosphereThis may be true, but we have evidence that US Secretary of Defense William S. Cohen, the son of a

Russian (Jewish) immigrant, stated in a 1997 speech at the University of Georgia that earthquakes and volcanoes could be triggered remotely through the use of "electromagnetic waves."[47]This corresponds to the intention stated in U.S. patent no. 4,686,605 of August 11, 1987.

In reality, time-altering technology has been used since World War II. We have evidence from the Daily News, a newspaper from Charlotte Amalie, in the U.S. Virgin Islands, No. 8075 of September 17, 1947, that the Army, Navy and General Electric Company were collaborating on a "daring meteorological experiment"called Project Cirrus to study hurricanes. The same newspaper admitted that silver iodide had been used in Tucson from 1950 to 1952 in an experiment that increased rainfall by 120 to 125%.

A later historical report[48] The Cirrus project published in 1952 similarly confirmed that on October 13, 1947, General Electric, along with the U.S. Army, the Office of Naval Research, and the U.S. Weather Bureau, had dropped 200 pounds of dry ice into a tropical cyclone 350 miles east of Jacksonville, Florida:Shortly after seeding, the hurricane abruptly veered towards the southeastern United States.The crew reported:

«Instead of dissipating, the storm abruptly veered nearly 130 degrees west and struck Savannah, Georgia, causing $2 million in damage. Threats of legal action quickly followed, with Georgians blaming the government for the devastation.».

On May 1, 1955, Irving Langmuir, director of the atmospheric research department at General Electric, confirmed in the Lincoln Journal Star that this experiment had indeed taken place on October 13, 1947, and admitted that the Kansas River floods of 1951 could also be attributed to cloud seeding.

The experiments continued, and in 1965, Project Stormfury targeted Hurricane Betsy for seeding. Instead of hitting South Carolina as planned,the storm has stopped" and "crossed the Bahamas" and "South Florida»[49]Photos of the devastation caused by Hurricane Betsy show vehicles submerged up to their roofs.

Technological patents provide further evidence of geoengineering. U.S. patent 3613992 of 1971 protects climate-influencing satellites.[50]US patent 4686605 of 1987, filed by Bernard Eastlund, concerns a device that allows formodify a region of the Earth's atmosphere, ionosphere and/or magnetosphere»[51]The 1991 US patent 5003186A for Welsbach stratospheric seeding is supposed to "reduce" global warming by manipulating heat and therefore pressure.

On April 28, 1997, U.S. Secretary of Defense William S. Cohen not only admitted that electromagnetic waves could trigger earthquakes and volcanic activity, as mentioned above, but he also stated thatsome scientists"were developing pathogens and insects"specific to certain ethnic groupswhich could destroy specific crops[52]It is important to emphasize, for my argument, that Cohen's father ensured that his son was "raised in the Jewish religion, attends a synagogue and also takes courses at a Hebrew school in preparation for his bar mitzvah».[53]

Coincidence or not, from 1972 to 1989, while Spain was experiencing the height of CIA-backed terrorism on its soil, it also suffered catastrophic floods in the Segura basin, on the southeast coast, and in other major cities.[54]If this is the case, it would coincide with the US war in Vietnam, during which the CIA assassinated the Catholic and aristocratic president of South Vietnam, Ngo Dinh Diem.[55]Operation Popeye, conducted by the United States in North Vietnam, resulted in over 2600 cloud seeding missions that prolonged the monsoon season and reportedly increased rainfall by 30%.[56]Terrorism in Spain began very publicly with the spectacular assassination in 1973 of General Franco's successor,

Luis Carrero Blanco. After an eight-hour meeting during which Blanco failed to reach an agreement with US Secretary of State Henry Kissinger on nuclear weapons and other issues, Blanco's car exploded 100 meters (one block) from the American embassy. It was thrown about two meters into the air and landed inside the walls of a monastery.

The floods of 1982 and the "Riada" of November 4, 1987, from Valencia to Orihuela (beyond the city of Alicante), for example, are still commemorated. A farmer, who must have been around fifty years old when the floods occurred and who hadn't slept for four days, terrified of losing his livestock, remembers his elderly mother saying she had never experienced floods like these in her entire life.[57]A Moroccan restaurant I visited in the center of Valencia in November 2024 still marks the spot where the water rose that day in 1987 with a tile about 2,7 meters above the ground on which is inscribed "Hasta Aquí Llegó el Agua"(The water rose this far). That day, the Spanish army actively helped citizens evacuate and pulled them from the water using helicopters."[58]In 2024, the army, which is stationed nearby, arrived only a day later. Many Valencians say they arrived a week later and were mostly volunteers, meaning they lacked the equipment needed to rebuild infrastructure. This act, which strongly resembles the events in western North Carolina, suggests malicious intent on the part of the government. Those on the ground in North Carolina, such as the Christian Rangers, Louisiana Cajun Navy, and Save Our Allies, can attest that FEMA's goal appeared to be to let as many people die as possible. Little effort was made in Valencia and North Carolina to recover the bodies of victims from the mudslides and flash floods that followed the opening of the water-filled dams, because if missing persons are not found and identified, they cannot be added to the official death toll.[59]In the case of North Carolina, resources were often confiscated and volunteers were turned away.

It is important to note that at the time, FEMA was under the control of Alejandro N. Mayorkas, Secretary of the U.S. Department of Homeland Security (as it has been since Hurricane Katrina). Although Mayorkas was born in Havana, Cuba, and is presented as Hispanic, he was born to Jewish parents and raised in Beverly Hills, Los Angeles, California. When asked about North Carolina, Mayorkas replied:My God, you know", the United States was not prepared to face "the severity and frequency of extreme weather events" who "have only intensified over the years»[60]Not only is Mayorkas implicated in the murder of civilians, such as George Soros, but he has also been accused of redirecting resources to illegal immigrants.

In "Unleashing the Storm: The Secret History of Weather as a Weapon(Unleashing the Storm: The Secret History of Weather as a Weapon)[61]Joey Gilbert provides declassified evidence from the U.S. State Department and the CIA regarding American military operations that manipulated weather conditions during the war. From 1967 to 1972, Operation Popeye used silver iodide to induce rainfall in North Vietnam. Among other "Notable weather eventsExamples include: Project Stormfury (1962-1983) to control hurricanes; the Soviet Snow Seeding program (1940s-1950s); the Battle of Britain (1940); and the Fog Control program (1940s) during World War II to conceal Allied operations such as the Normandy landings. Joey Gilbert notes in his sources that the 1977 United Nations Treaty on the Prohibition of Environmental Modification Techniques (ENMOD) and the "Climate Modification Hearings" held in Washington, DC, defined environmental modification techniques as techniques that deliberately manipulatethe dynamics, composition or structure of the Earth, including its biota, lithosphere, hydrosphere and atmosphere».

Joey Gilbert also points out that climate modification is accessible to the public. If, for example, you want a sunny day for your upscale wedding reception or perfect weather during your honeymoon/vacation, you can contact a UK-based travel agency, Oliver's Travels, and purchase their cloud-seeding services which, for $100,000, guarantee clear skies (but only in France), except in the event of a "natural disaster."[62]. According to the website The State Journal-RegisterPotential rain clouds are dispersed in advance by the travel agency when "silver iodide" causes the clouds to condense and rain to fall. A website of CNN announced in 2016 that the company charged $150,000 and required six

weeks' notice. However, according to the website of CNNThese are salts such as sodium chloride that Oliver's Travels dispersed directly into the "towering cumulus clouds" or "wecumulonimbus", as well as the "smoke»[63]One might begin to suspect that something is amiss in these scientific explanations when one considers the fact that something is dispersed all day, every day, over large and small cities under clear blue skies.

Another chemtrail story is that of Christopher W. In January 2023, a Lufthansa pilot was fired after an investigation revealed that he had not activated the chemtrail system on more than thirty intra-European flights out of a sense of duty. Lufthansa is the richest airline in Europe and a founding member of the world's largest airline alliance, Star Alliance. The 36-year-old pilot, struggling with an internal conflict, took the case to the Nuremberg Tribunal, which cost Lufthansa hundreds of millions of euros for the delay (more than the aid funds given to Italy and Valencia combined), as well as a loss in Lufthansa's cloud-seeding business in 2024, which was transferred to its competitor Ryanair.[64], the company that serves more interesting destinations such as Morocco, Israel, Italy and London.

According to Joey Gilbert, the use of chemtrails to modify the weather is also evidenced by China's use of climate modification programs in order to "to ensure favorable conditions"for the 2008 Beijing Olympics. Furthermore, the World Meteorological Organization (WMO) stated that "climate modification technologieswere used in more than 50 countries.[65]

Skeptics argue that the world is too vast to manipulate time. On the other hand, what happened in Valencia had just occurred in North Carolina the previous month, including the unnecessary opening of a dam's floodgates. In North Carolina's case, the Lure Lake dam was opened due to a "risk of breach," a claim that was later proven false.[66]The Spanish, however, were not only pointing the finger at chemtrails/cloud seeding, but also at other associated technologies. The Valencians claimed that various HAARP and military antennas were located in the area and had contributed to the "genocide." One of these HAARP antenna fields was apparently located in Morocco, suspected of having caused the earthquake that struck that country a year earlier, on September 8, 2023. At that time, HAARP was also linked to earthquakes in Turkey, Syria, and Indonesia.

During the same month, Morocco experienced an earthquake that killed nearly 3000 people, while Greece was experiencing the "worst rainfall in its "history"»[67]The rains affected Volos, Pelion, Trikala, Karditsa, and the Thessalian plain. According to NASA, which was observing the situation from space using its satellites and those of its partners, there were initially "heat waves and fires"unusual, then some"torrential rain"which focused on the Thessaly region and causedcatastrophic floods in Spain, Greece, Bulgaria and TurkeyDuring the four-day storm that began on September 4 and centered on Greece,The waters submerged houses, transformed streets into raging rivers, and swept cars out to sea.»[68]NASA stated that the storm was caused by a high-pressure system sandwiched between two low-pressure areas, resulting in 76 cm of rain, more than the annual average. NASA concluded its report by acknowledging that the total amount of rain could not be recorded becauseWeather stations have stopped transmitting due to power outages»[69]Similarly, in the case of Valencia, the weather radars were out of service before the storm occurred. Exactly one year later, a sea of dead and decomposing fish clogged Greek waterways, resulting in adrastic drop in the number of visitorsThis attack on tourism has been attributed to the 2023 floods, when freshwater fish were swept into the ocean, but I would be more inclined to attribute it to an underwater explosion.[70]In 2024, we had volcanic eruptions in Iceland (seven since December 2023) and in Indonesia on October 27 and November 2024, dates that coincide with the catastrophic floods in Spain. Another coincidence in all these simultaneous disasters is that the public doesn't hear about them.

When Zaid Musa Badwan, a mechatronics engineer from UNAM in Mexico, and also CEO and co-founder of Mediprint (3D printing), was asked about the HAARP project in a 2020 interview with How wonderful, Fernanda!He began by explaining that the history of humanity is the history of wars and that, consequently, technology is always funded for military applications. Wars also accelerate the creation of new technologies, which then lead to significant geopolitical shifts. Badwan explained that comparing past and present weather technologies is akin to comparing the difference between fighting with a supersonic jet and a conventional aircraft, between a machine gun and a rifle, or between a nuclear bomb and a hand grenade. We possess, Badwan explained, enough nuclear weapons to destroy the entire planet 17 times over.[71]But nuclear weapons are obsolete and important new weapons must remain hidden, not only with regard to their deployment, but also their very existence, he said, referring to the HAARP project.[72]

HAARP technology relies on a gigantic radio antenna, the purpose of which was to communicate with nuclear submarines located deep beneath the sea. The stated goal of this $300 million project was also to allow the Marines and the US Air Force to "study the ionosphere." Strangely, the end product, the HAARP antennas, operate at only 0,5% of their capacity. Why, Badwan asks, create something that operates at less than 1% of its capacity? Today, the antennas emit frequencies toward specific points in the ionosphere in order to warm it. This is important because the ionosphere is the layer that controls the climate and influences other layers. Contrary to Badwan's explanation, the HAARP website insists that the radio waves emitted by HAARP do not control "never"The weather. Just like"the sun itself", including "ionospheric storms» n'do not affect the weather on the surface"There's no chance."that HAARP can do it»[73]This claim is dubious, as other major ionospheric research centers acknowledge that one of the reasons for studying the ionosphere is to see how it affects Earth and weather patterns. One such center is the Space Research Group at the University of Alcalá de Henares, which studies how changes in the ionosphere enhance or disrupt satellite communications and GPS signals, as well as the impact of solar activity in the ionosphere on climate and changes on Earth. I learned about this in Alcalá de Henares through a video presented by the Space Research Group in what resembled a Disney attraction waiting room, due to the presence of foil satellites. The building housing the exhibit was once an important historical parish church in Alcalá de Henares.

Alcalá de Henares is the true first Spanish capital. Its fortified walls house not only the house of Miguel Cervantes, author of Don Quixotebut also the Roman martyred children Justo and Pastor, whose blood shed in the name of the Christian faith founded the city in 304 and perhaps even Christian Spain. Alcalá is also home to the sacred relics of Bishop Cisneros, who traveled throughout Spain to prevent Protestantism from taking root, as well as the model university founded by Bishop Cisneros in the 1500s, one of the first in the world, andthe world's first planned university city»[74]Alcalá is also home to the residence where Queen Isabella received Christopher Columbus, as well as the tower where she gave birth to the future Queen of England, Catherine of Aragon, in 1485.

The Alcalá de Henares Space Research Group, however, is no longer so exclusively Hispanic, as it works in partnership with the United States and boasts of being one of Europe's leading centers of expertise in space weather. In the university's historic administration building, a banner indicated that the Alcalá research group had participated in the design of a MEDA, a set of sensors used to study weather conditions on Mars, which was ultimately used by NASA for the Mars Pathfinder/Sojourner Rover mission. The rover was launched from Cape Canaveral, Florida, and is believed to have landed on Mars in its "former floodplainAres Vallis launched the rover on July 4, 1997, after $265 million had been spent on its development. However, recent developments suggest that the rover's photos could have been taken in a red, arid mountain landscape in Algeria, such as the Tadrart Rouge or Tassili N'Ajjer National Park. This is not an insignificant clue, given that after the Valencia floods, researchers studied the initial movement of the clouds and determined they originated in Algeria. I will provide the story and corresponding coordinates later in this article.

Langues »

The three major projects of the Alcalá de Henares Space Research Group—ORCA, IcaRO, and CaLMa—presented in the recently mentioned abandoned parish, had interesting locations and significant equipment, leading me to believe that the money for the ship, facilities, and equipment came from other nations wanting to use Spanish territory as a base for their antennas and transmitters. ORCA is located at the Juan Carlos I base on Livingstone Island, Antarctica (operational since 2019); IcaRO, designed by AEMET (Agencia Estatal de Meteorologia), is located on an island west of Morocco; and CaLMa is based in central Spain. In other words, the United States does not need to deploy its U.S. Navy maritime radar platform to monitor Spain's activities, as it does with less friendly countries. Spain has participated in EU-funded research and international radar networks such as SuperDARN (Super Dual Auroral Radar Network), which studies the effects of HAARP experiments. Spain is also a member of the European Space Agency (ESA), the Andalusian Institute of Astrophysics (IAA), and the Institute for Space Sciences (ICE).

ICaRO is located in the Canary Islands, off the coast of Morocco, at the AEMET's Izaña Atmospheric Observatory, within the Teide National Park on the island of Tenerife. Since March 2023, it has been managed by AEMET. It sits atop a mountain at an altitude of 2400 meters. Its measurements are used to verify those of ORCA. NASA has used this site since 1941 for atmospheric measurements.[75]Significant advances and changes were made to the center between 1957 and 1958, and again in 1989, in order to study the atmosphere. In 1989, this site became one of the thirty sites of global interest and importance. The location of these powerful meteorological sites is perhaps the reason why Spain still mourns the "longest eruption of known historywhich took place in La Palma for 85 days of continuous activity starting on September 19, 2021, during the pandemic. Two important points that the Alcalá Space Research Group highlighted in its presentation are the need to operate these stations remotely and the fact that the ORCA and ICaRO stations are in a certain uninterrupted physical alignment, with regard to their location.

The exhibits and videos from the University of Alcalá de Henares emphasize the importance of the Earth's magnetic field. Consequently, the university's research group studies the effects of intentionally heating the ionosphere on the magnetic field and other sources of magnetic perturbations. Magnetometers are typically used in these experiments. Similarly, HAARP devotes considerable time and resources to the Earth's magnetic field and has admitted to influencing phenomena such as the aurora borealis, which are also linked to the Earth's magnetic field. As the Alcalá research group explains in its exhibit,Auroras are the best part of magnetic storms(Auroras are the most beautiful part of magnetic storms to see.) We can conclude from this information that HAARP causes magnetic storms. Similar to HAARP, researchers at the University of Alcalá de Henares send high-frequency radio signals via HF transmitters into the ionosphere (in the 3-30 MHz bands) to replicate the sun's plasma waves. Unlike HAARP, the Alcalá scientists acknowledge that the ionosphere plays a role in weather patterns.

One reason the Earth's magnetic field is important is that the Earth wobbles on its axis. If this is true, then by consistently sending the right frequency at the right time and place, HAARP can eventually reach the point of imbalance in such a way as to increase the wobble. In one of my favorite articles of Culture Wars, who are "The Age of CatastropheIn his book, *The Age of Catastrophes*, published in June 2020, Silvano Borrusco explains that the more the Earth wobbles, the more the tectonic plates move, causing earthquakes and volcanic activity. And scientists have certainly recorded a surprising increase in this wobble. At the very least, U.S. Secretary of Defense William S. Cohen informed us that electromagnetic waves can awaken volcanoes and trigger earthquakes.

Zaid Mussa Badwan explained that sending specific frequencies into the ionosphere can cause earthquakes, droughts, tsunamis, and so on. Thus, if we have an enemy, Badwan explained, we can send them a wave the size of one of their coastal cities, and then we can even help them clean up after the disaster in order to disorient them or take control of the site. For this reason, Badwan calmly explained, nuclear weapons belong to the past. The new weapons are

biological, because we can create a weapon that targets a single individual if we have their biological profile. With this last statement, Badwan was not referring to the latest James Bond film. No Time to Diebut rather to the Covid virus and the vaccines, which, combined, have intentionally killed, paralyzed, and weakened millions of people. In my own family, almost the entire generation of my grandparents and their siblings was decimated after the vaccine rollout, and younger members have also died from sudden heart attacks and rampant cancers. Other family members suffer from chronic fatigue and visible blood clots.

As established by the Chinese military expert Sun Tzu in The art of War, who are "The supreme art of war consists of defeating the enemy without fighting.This is the type of war we face today. The victims cannot identify the enemy because the enemy remains hidden behind what appear to be natural phenomena and hermetic bureaucratic circles. Not only does the enemy seem invisible, but its victims also resist the idea that it might be implementing a harmful, long-term strategic plan that could be studied and countered. Why not study the common patterns in our enemy's strategies and the weapons it prefers to use? Why not ask who are the people willing to commit genocide today? Is there any other nation besides Israel that shoots women and children, aiming for the head, neck, and torso, while simultaneously preventing people from receiving aid and food?

We have already examined the evidence of rainfall manipulation. I would like to add a few necessary points about climate manipulation that I learned from those who communicated about the great tragedy in Valencia in October. The first congress on chemtrails, the environment, and health, held in Barcelona in 2016, featured an informative lecture by Roger Serrahima:Matematic Patterns in the Sky: Climática a Gran EscalaSerrahima first highlighted how sound frequency can affect malleable materials, such as water, to create visible patterns and shapes, to such an extent that the frequency of the emitted sound wave can be determined by the visible patterns formed by the materials affected by the waves. Serrahima pointed out that leaving a metallic trail of particles in the sky significantly increases the conductivity of the atmosphere, making it more susceptible to electromagnetic waves emitted by radar. Different frequencies create visible patterns in clouds, which often exhibit unnatural symmetry and a distinct wavy pattern. There are also clouds that stand out as unusual within a group of "normal" clouds. Around Doppler radar stations (as seen in the photos) and in Valencia (in person), I've seen circular, high-lying clouds that subsequently developed a deep hollow or dimple in their center, as if a giant thumb had been pressed into it, while the surrounding clouds appeared normal. This indicates pressure acting directly against the bottom of the cloud. Luz Calero and Unai Ramos, a couple from Chiva, reported observing a tall column of clouds that remained stable for hours despite strong, constant winds. The wind was powerful, and rain was lashing all sides of the house, but the clouds were motionless. Afterward, it was difficult to breathe because the air seemed liquefied, and the smell was artificial, synthetic, and "deadly." Breathing caused their throats to become sore.[76]Others reported a prolonged piercing noise, and other Valencians stated that the Karadeniz Powership Onur Sultan, equipped with an impressive array of antennas and considered the "world's largest floating power plant" had been spotted off the Spanish coast during the storm[77]Even if this ship did not influence the storm's movements, if it played a role, it may have provided power to the offshore Doppler radars, which were active.[78]Others have argued that the ship is indeed carrying Doppler radars, as well as electricity generation technologies.

During Tropical Storm Dana in Valencia, weather observers noticed that the clouds were moving against the prevailing winds, forming a perfectly symmetrical circle, which is unusual. The visible circle formed by the clouds allowed them to locate its center. At the center of the circle, atop a mountain range west of Saida, Algeria, was a field of tall antennas similar to the HAARP antennas in Alaska. This field is located approximately 161 miles east of Oujda, Morocco. The exact coordinates on Google Maps are 34°45'34.1"N 0°10'47.2"W.

In his presentation titled "NEXRAD and HAARP: American Climate Manipulation, an Undeniable Link," Roger Serrahima pointed out that there are approximately three national Doppler radar sites in each U.S. state. Their frequency bands cover most of the U.S. territory, and their radar activity can be detected and observed by satellites. England is also covered by Doppler radar. The 1988 Nexrad weather surveillance radar, or WSR-88D radar, resembles a white golf ball resting on a tower, its white spherical structure protecting the antennas inside. Similar structures can be seen at military bases and other sites in Spain and neighboring countries, and they have a visible effect on cloud formation around them. Some of the Spanish radars Serrahima mentioned are located at Xesteiras en Cuntis in Galicia, El Pico Mijas in Malaga, and in the Canary Islands (Radar La Palma). Once again, the Spanish volcanic activity at Cumbre Vieja occurred on an island west of the Canary Islands that houses the NASA or AEMET observatory in Tenerife.

Like sleigh bells playing Christmas carols, radars work in perfect harmony, depending on their location, to create weather vortices or push cloud formations in a particular direction, even against the wind. These pulses are also capable of breaking up smaller, unwanted "systems." The phenomenon of a cloud remaining stationary for hours despite strong winds has been observed around storms in Valencia. This activity was very clearly observed from space by simultaneously watching the radar pulses and cloud movement. In one of Serrahima's videos on Doppler radars, we are shown radar pulses and cloud formation tracked over a four-day period, and during those four days, the center of the vortex does not move but remains constant. The radars emit pulses in perfect harmony to gather and collect rain-laden clouds.

Another important aspect of weather manipulation is the creation of the clouds themselves. Clouds carry water. Water can be condensed or extracted from the sky, notably through cloud seeding, but an even faster and more efficient method is to have power plants release heated and vaporized water into the air day and night. According to Shoalei Ren, a professor of electrical and computer engineering, power plants "They use large cooling towers that transform water into steam, which is then emitted into the atmosphere.Satellite images of Earth show that these cloud factories are strategically aligned and spaced to create a wall of clouds rising from Earth into the atmosphere. Before leaving for Spain, I drove to one of these factories, called Rathdrum Power LLC (NAES Safe Operated Facility), in northern Idaho, and found that the entire building was essentially a chimney from which a truly enormous cloud was constantly escaping.

In addition to power plants producing water-laden clouds, we now have "cloud data centers," such as those in Oregon and Washington, D.C., which AWS employees say are the size of several airports placed side by side. Or, as David Danelski puts it, data centers are warehouse-sized buildings housing stacks of servers—the famous cloud spaces where everyone's internet information is stored. These hundreds of thousands of servers in data centers must be kept cool because the electricity flowing through semiconductors continuously generates heat. This requires cooling systems that, like power plants, are typically connected to "cooling towers that consume water by transforming it into steam»[79]This allows the heat to be removed from the data center. In other words, not only do these buildings require a lot of energy, meaning that power plants must draw more fresh water, but the data processing and storage centers themselves need billions of liters of fresh water, all of which ends up in the sky as clouds. The University of California, Riverside estimated thatGoogle's data centers in the United States alone consumed approximately 12,7 billion liters of fresh water in 2021 to cool their servers.", at a time when agriculture was suffering from droughts. Professor Shoalei Ren described this secret water footprint of AI as "an increasingly severe freshwater shortage crisis… and rapid aging of public water supply infrastructure».[80]

In short, those who literally control our energy, technology, and internet also produce clouds that can then be moved to flood-prone areas to fill dams, which are then opened to destroy cities and seize control of their freshwater sources. One of the most prominent companies in this regard is Google, founded by two Jewish figures: Sergey Mikhailovich Brin and Lawrence "Larry" Page.

But are the hydraulic infrastructures really "aging," as Professor Ren argues, or are they neglected and systematically destroyed? Let's examine the tactics used in the case of what appears to be one of the hundreds of dams dismantled in Spain in recent years.

In the midst of the Covid pandemic, in the illustrious and historic city of Arévalo, Spain, soldiers patrolled the streets to ensure no one went out—a pointless precaution in a city already sparsely populated and aging. Businesses were already struggling with exorbitant taxes and a scarce, dispersed clientele. Yet, this military surveillance continued even after other cities had returned to normal, which residents found suspicious.

On May 25, 2021, a conference entitled "Participatory Days of Medio Ambiente and Landscape» was held in Arévalo, during which Francisco Durán, an environmental scientist, presented proposals on behalf of the Duero River Basin Confederation (Confederation of Hidográfica del Duero) aimed at cleaning the banks and bed of the Arévalo River. When Ricardo Guerra Sancho, former official chronicler and historian of the city of Arévalo, realized that the proposed plan included the removal of the small, popular dam of "la Isla" or "la Pesca" so thatfish can swim upstreamHe was very worried, as were the locals. "La Isla" refers to the small island formed at the confluence of the La Adaja and Arevalillo rivers, behind the Arevalillo Castle, which belonged to Queen Isabella the Catholic. It is a particularly beautiful little corner of natural paradise, open to the public, which evokes the time when Queen Isabella the Catholic used to walk on this very land, especially during her youth. La Isla is where the townspeople used to swim and fish during the summer days, as the dam there created a freshwater pool. The fish from the La Adaja to Arevalillo rivers are incorruptible, perhaps ever since Saint Teresa of Ávila crossed these waters to found her convents of Discalced Carmelites in Ávila and Medina del Campo. This is not a legend. Scientists studied the water and determined that this peculiarity was inexplicable.[81]

A local resident told me that to verify the truth of this story, he had kept a fish without gutting it, and that it had never rotted, but had remained incorruptible like some incorruptible saints' bodies for "years and years". "There must be a mistake", said the historian Guerra (Guerra means war), because "The mill of "la Isla" has been part of the life of this town since the 1300s.

This mill is part of the industrial heritage of Castile and León and its origins date back to the Middle Ages. Furthermore, the original structure has remained intact throughout the centuries, despite modifications made to adapt the dam to the industrial needs of each era.».

To this day, Arévalo remains one of the most important wheat milling centers in a region of Spain renowned for its grain storage facilities. This industry was established through meticulous engineering, planning, and construction spanning centuries. The control and management of river networks and waterways played a crucial role in this process. Yet, despite Guerra's protests and his 35-page document detailing the long history of this particular dam, and despite the protests of the locals, who lost their pleasant swimming and fishing spot as well as their open-air social gathering place behind their castle, the dam was destroyed, and the canal is now too low and choked with vegetation for swimming. Following the destruction of the dams in early 2024, water rushed in and destroyed part of the promenade and cycle path around the castle, filling the area with rubble and heavy debris that has yet to be cleared or the path restored. The water level so high that it almost reached the large bridges leading to the castle and the town.

Langues »

Although the city is unlikely to ever flood due to its considerable elevation above the two rivers, this project was clearly part of the destruction of the Las Cogotas Reservoir near Ávila. The Adaja River flows through the Las Cogotas Reservoir and then travels 30 miles to Arévalo. From Arévalo, the river continues to the center of Valladolid, one of Spain's largest and most important cities. Further north, its waters flow into the sea, supplying the coastal cities of Santander and Bilbao. Spain's official website states that the dam was built next to a Celtic fort during the Iron Age, 100 years before Christ. The dam guarantees the drinking water supply for the provinces of Ávila and Valladolid, Olmedo and Medina del Campo, and is an important area for water sports. The residents of Arévalo, who stroll daily along the charming paths of the castle, now regret not having followed the example of the residents of Badajoz, who courageously refused to have their much larger dam demolished. They even stood guard at night to prevent the government from destroying it while they slept.

As in other countries, Spain's most important cities are located around major rivers and along the coast. After the severe floods of the 1950s, General Franco altered the course of the Valencia River and reinforced the banks of the new channel with cement to prevent collapse during floods. It was these dikes and dams built by Franco that saved Valencia's city center in October, as the new canal was on the verge of overflowing but held firm. This occurred despite the fact that other dams built by Franco were deliberately destroyed. I believe the objective was to flood this vital city center and also to destroy the extensive railway lines that connect the port to the interior and the Spanish coast. Pilar Esquinas and others have pointed out that after disasters like this, banks intervene to lend money and enslave the population with debts impossible to repay.

The reality is that heavy rains are necessary to conceal an open genocide and the destruction of livelihoods, homes, and crops. The elites no longer need to wait for specific weather conditions, as they can manipulate them to their advantage.

Floods in Texas

Let's examine a case where the dams were not destroyed and the population was warned to evacuate. Let's look at Texas.

In May 2024, the lands of Southeast Texas were flooded after water was released from the Livingston, Houston, and Conroe Lakes reservoirs. Similar to those in Spain, these reservoirs were lakes formed when dams were built on various rivers. As indicated by the Texas Tribune : "The operators of the three main reservoirs located on the region's rivers released water "in order to protect the dams against any possible breach."»[82]Buildings and homes were flooded, sometimes up to the second floor, in some of the most beautiful and wealthy neighborhoods in Texas.

According to Rick Warner, who operates the Houston Lake Dam, the dam's gates are opened before the rain falls to make room for more rain:This gives us a bit of a head start in releasing the water before the floodwaters reach the reservoir.Warner said he received this instruction from the city of Houston, which owns the lake. It's true that releasing water through the dam could cause lakes further downstream to swell due to the early release, but the main issue was that East Texas had already received about 24 inches more rain than usual.for the same period", the normal being one inch, which means there has been "over 25 inches"of rain due to storms"clear". "This is not a normal spring flood"One of Houston's meteorologists said that in this case, authorities warned residents to evacuate immediately because the Livingston Lake dam was about to overflow." Texas Tribune stated that it was "of the largest water spill in the lake's history».[83]

This is what happened in the case of Valencia, because independently of the release of water from the surrounding reservoirs, the town of Chiva experienced unprecedented rainfall. The precise location of the rainfall allowed the water to flow down the mountains and hills along the ravines, forming the stream called Rambla de Pollo, which then flowed into Paiporta.

In North Carolina

In the case of western North Carolina, the "abnormal" hurricane moved up from the Gulf of Mexico. Like any Floridian, I can tell you that once a hurricane makes landfall, it loses strength. Historically, those who live in central Florida, like my family, don't have much to fear, even from a Category 5 storm. Yet, Hurricane Helene, a Category 4, miraculously held its own as it moved up the Appalachians. Following what appears to be a thermal satellite view of the clouds, weather observers highlighted how "NEXRAD" was guiding the storm and slowing it down to allow it to unleash its "payload»[84]Periodically and systematically, radar picks up what appear to be straight lines radiating out in different directions from within the hurricane. These lines are visible in the same way that the hurricane itself is distinct and visible. Similar beams were spotted in October 2012 on the CIMSS Integrated Microwave Imager (MIMIC) around Hurricane Sandy before it gained strength and made an unexpected turn toward New Jersey. Hurricane Helene was twice the size of Hurricane Katrina, a case in which FEMA followed a protocol similar to that of North Carolina. As in Texas, rainfall was historic. According to Governor Roy Cooper in "Hurricane Helene Recover," North Carolina experienced "floods of a thousand years' worth in several counties". The "floods, landslides, high winds and tornadoes"Historical events caused $59,6 billion in damages."[85]

According to David James:

«We all sensed that land appropriation in western North Carolina was imminent, but none of us really knew how it would manifest itself on the ground. Well, as of November 6th, we can all take off our tinfoil hats, because FEMA has officially launched a "land acquisition project" in the areas affected by Helene.».

At the time, everyone agreed—and this is even more true today—that the government coveted one of the three purest lithium mines in the world. A few months earlier, the U.S. Department of Defense had awarded $90 million to Albermarle to reopen one of its lithium mines at Kings Mountain, and another company, Piedmont Lithium, had already reached agreements with Tesla and planned to invest in a $1,8 billion mine in Gaston County. Both companies needed zoning approval from Gaston County.[86]

According to the US Geological Survey, the United States has more than 6,8 billion tons of "identified" lithium resources in Nevada, North Carolina, and Arkansas. Albemarle Corporation has identified Kings Mountain, North Carolina, which has one of the world's richest lithium deposits, as "critical" to theglobal transformation towards clean energySpruce Pine, North Carolina, located northeast of the devastated city of Asheville, has one of the world's richest lithium (spodumene ore) deposits, as well as high-purity quartz sand (Sibelco) useful for the solar energy, semiconductor, and fiber optic markets. Spruce Pine hasenough quartz to meet global demand for AI chips»[87]Science journalist Nikki Main stated that this "small lost town"would help fuel the AI revolution and had enough quartz to power the entire global semiconductor industry, which is worth $530 billion.[88]

In December 2023, we learned on WUNC, North Carolina's public radio station, that the Albermarle Corporation, closely linked to the pharmaceutical and specialty chemical industries, was building a "global lithium empire"based in Charlotte, North Carolina. The company "wants to lead the development of an American supply chain to meet the growing demand for lithium for the batteries that power everything from electric vehicles to cell phones and laptops.Unprocessed lithium from around the world is shipped approximately 50 km west of Charlotte to the Albermarle

processing plant at Kings Mountain, where it is transformed intorefined lithium in white powderThe factory processesthousands of tons per year"Near the processing plant is Albermarle's research and development center, andJust down the hill, Albermarle hopes to reopen a former open-pit mine that was among the world's leading sources of lithium until its closure in 1988.».

Albermarle admitted in December 2023 that it was investing $200 million in a research center, $400 million in a new factory, and $1,3 billion in another new factory in Chester, South Carolina. Albermarle is one of Wall Street's favorite companies. The goal is to extract enough raw material to produce 50,000 metric tons of processed lithium per year to power batteries for 1,2 million Internet of Things (IoT) electric vehicles annually. To reopen the mine, Albermarle received "a $90 million grant from the U.S. Department of Defense for critical mineralsThe agreement specifically targeted the Kings Mountain lithium mine to increase production for the national battery supply chain from 2025 to 2030.[89]

There were only two problems. Another company, Piedmont Lithium (CEO Keith D. Phillips), based in Belmont, also had its eye on the lithium in Gaston County and was awaiting a mining permit from the state for a "site located in northern Gaston County, near Cherryville", but the residents and local authorities opposed it[90]As reported by WCNC,the residents of Cherryville have been opposing a lithium mine project for several yearsPiedmont Lithium had already reached agreements with Tesla and planned to invest $1,8 billion in a mine. The second problem was that the region is primarily made up of farmland and houses.[91]

Kent Masters, Albermarle's chairman and CEO after Luke Kissam, has little biographical information online, making it difficult to determine if he is also Jewish. However, it is worth noting that a few days[92] before 60 cm of rain and "waters laden with debris"do not fall upon North Carolina,"destroying almost all the buildingsMarshall's ruiningthe shops in the city»[93]The Israelis detonated the lithium batteries of at least 7000 electronic devices. According to RT correspondent Yasin Eken, this included the cell phones, laptops, fingerprint scanners, and radios of Lebanese citizens, with two separate attacks on two different days. This suggests the Israelis have the capability to destroy thousands of communication devices in an instant, perhaps simply by increasing their power consumption and heating them up, as can be done in a cyberattack. Following this war crime, RT Breaking News reported that Israel "remained silent" and that US Secretary of State Anthony Blinken denied that the United States had any prior knowledge of the impending attack. It is also worth noting that Kent Masters is working with the Chilean government to nationalize the country's lithium mines and control the contracts.[94]
According to the FEMA Risk Mitigation Procurement Program:To help minimize future flood losses, the North Carolina Buyback Program includes the acquisition and demolition/relocation of structures – the community, with FEMA funding, purchases the property from the owner and demolishes or relocates all structures on the property».

David James continues:

«Once local authorities condemn buildings or deny building permits for various reasons, FEMA steps in and buys back the properties at "75% of the fair market value" of the land, whether the house is damaged or not. This means people are forced to leave land they have occupied for generations and receive paltry payments from FEMA and/or its contractors. They also facilitate demolitions. FEMA uses the environmental agenda and the rhetoric of human-caused climate change to justify sweeping changes in zoning and permits, claiming that human-caused climate change will continue to cause flooding in areas that have never experienced it before. That's why they're establishing new

floodplains (within 100 and 500 years), making it virtually impossible for residents to obtain building permits in these newly "floodable" areas—areas that have existed for hundreds of years and have never experienced flooding of this magnitude before Hurricane Helene.».[95]

When Alejandro Mayorkas, the FEMA official, was asked who needed the most help in the aftermath of Hurricane Helene, he replied that Asheville was just one community among six states.devastated by what is, frankly, a hurricane of historic proportions. The extent of its catastrophic effects is unprecedented».[96]

In Brazil

During the same month as the Texas floods, southern Brazil experienced flooding that displaced at least half a million people.[97]According to a Brazilian Catholic priest I met in Segovia, the army and the central government did not prevent the floods or help the victims.

According to Weber Braga, author of Culture Wars and residing in Brazil:

Rio Grande do Sul (RS) is known for its heavy rains and flooding during the summer (between January and April). However, the 2024 floods took an unexpected turn, as the RS weather centers failed to warn the population about the impending scenario. I spoke to people affected by the floods. Everyone said it was a completely unexpected event.

A Brazilian newspaper stated after the disaster thatThe floods that hit the RS were predictable, but the government had not invested in prevention»[98]On July 3, another specialist stated that the National Center for Monitoring and Warning of Natural Disasters (Cemaden) had been informed of the forecasts several days in advance.

Why then didn't the government inform the public about the disaster if it already knew it was going to happen? Shouldn't the government and the media be helping the people? Perhaps in the United States, yes. But in Brazil, of course not. The state of Rio Grande do Sul is a region situated within several basins, with many mountains and rivers, and it is relatively close to Antarctica . It is therefore a region that includes a large estuarine area called Lagoa de Patos, which is constantly subjected to heavy rains, snow, tropical cyclones, flooding, and so on. And the capital, Porto Alegre, is located within this estuary. The city is protected by 35 dams, 30 of which had been out of service for several years. If the disaster was "predictable," it was only in the case of Porto Alegre. My wife was born there and, according to her, the losses suffered by the city are irreparable.

Porto Alegre has always had a system of locks. Dr. Fernando Fan, a specialist at the Hydraulic Research Institute (IPH) of the Federal University of Rio Grande do Sul, stated in May 2005:The Porto Alegre lock system functions more as a system to delay the entry of water than as an effective flood protection system. Of course, this is perfectly fine, because until now, floods have been primarily prevented by the flood protection system. "[99]The dams can hold 3 meters of water. The flood reached 5,26 meters during the first ten days.[100]Did the same group that knew about the disaster several days in advance also know that the floodgate system wouldn't work? In any case, the capacity of the Guaiba River floodgate system was predictable. It could only handle a three-meter flood. Floods happen every year. But it seems that Governor Eduardo Leite or the mayor saw no problem with that.

In September 2021, Governor Leite decided to revitalize the old port of Porto Alegre, the Maua Pier, which had been for decades an effective flood protection system on the Guaiba River and was the city's primary protection system during the 2024 disaster. Leite intended to destroy the one-kilometer-long flood wall known as the Muro da Mauá in order to build a gay-friendly residential theme park on the banks of the Guaíba River after becoming a member of the World Economic Forum in 2023[101]His seat at the WEF gave Leite access to international banks and development loans. Usury and sodomy, as Dr. Jones would say—and stupidity, I would add—always go hand in hand when it comes to openly

Langues »

homosexual politicians, like Eduardo Leite; or like Ivo Gomes, the mayor of my hometown, Sobral, which I fled for lack of work; or like Pete Buttigieg, the U.S. Secretary of Transportation. In their case, some things are very predictable. The end of cities like Sodom and Gomorrah, or like Porto Alegre, has always been destruction, another name for bankruptcy, which is the long-term fate of states run by sodomites and usurers; followed by death, which is the wages of sin.

During the disaster, residents of several states, particularly Santa Catarina, rallied and sent supplies to the flood victims, but the Brazilian government did nothing to help. President Lula took no action until politicians in his inner circle saw the financial benefits of federal intervention. Lula signed bills for several politicians in Rio Grande do Sul to manipulate the outcome of the upcoming elections, which took place last October. They also attempted to tax all donors and censor those who had denounced government abuses against the population of Rio Grande do Sul on social media.

On May 15, President Lula signed a provisional law creating an executive office to support the reconstruction of the state of Rio Grande do Sul, and he appointed Paulo Pimenta as interim minister in charge of reconstruction. In practice, this gave him sweeping powers, such as approving federal bills and bypassing the government of Eduardo Leite, who has since been dismissed. The government had estimated that approximately 240,000 families would benefit from an investment of 1,2 billion reais.[102]To date, the victims have received no money from the government. At the end of July, the federal government announced it would invest a total of 7,4 billion reais in the state of Rio Grande do Sul as part of the PAC (Growth Acceleration Program).[103]Lula is known for using social programs to benefit his political protégés, and for many other things besides, such as financing money laundering.[104]

Once flood victims began rebuilding their properties, the government did nothing to rebuild the infrastructure. Meanwhile, the Climate Advisory Council of the Secretariat for Environment and Infrastructure (SEMA) of the state of Rio Grande do Sul (RS) was created in February 2023, in time for the 2023 World Economic Forum and Eduardo Leite's trip to Davos.[105]The state of Rio Grande do Sul, committed to the 2030 Agenda, has envisioned two ambitious programs: the strategic map of the government of the state of Rio Grande do Sul and ProClima2050.[106]which cites the creation of a climate roadmap as the most important strategy for combating climate change in the Soviet Union. According to the document presented on November 12 at the Climate Conference (COP29) in Azerbaijan, the objective of the climate roadmap is:

is to obtain a climate diagnosis based on the provision of local information from each municipality through data collection and the subsequent possibility of identifying climate change mitigation and adaptation strategies at the state level.[107]

In other words, this system would allow the monitoring of an entire state's activities, under the pretext of mitigating carbon emissions. We have never been closer to a bionic state. And this is how the dream of Klaus Schwab's right-hand man, Yuval Harari, is becoming a reality in Brazil. In 2017, Harari stated:

As the ecological crisis intensifies, the pressure for technological development will increase, not decrease. I think the ecological crisis of the 21st century will be analogous to the two world wars of the 20th century in that it will serve to accelerate technological progress. (…) People would be very cautious when it came to developing or experimenting with genetic engineering on human beings or entrusting control of weapons systems to artificial intelligence. But if you are faced with a serious crisis, caused, for example, by ecological degradation, then people will be tempted to try all sorts of high-risk, high-yield technologies in the hope of solving the problem… As we acquire more power, the question of what we do with it becomes increasingly crucial, and we are very close to actually possessing godlike powers of creation and destruction.[108]

Langues »

Rio Grande do Sul now represents the model for all Brazilian states, in line with the aspirations of the global elite. This signifies the full implementation of the 2030 Agenda in its entirety.

End of Weber Braga's story.

The Rockefeller Foundation

In May 2010, the Rockefeller Foundation published "Scenarios for the future of technology and international developmentIn this thought experiment, the Rockefellers predicted an avian flu epidemic that would decimate the younger generation. They argued that the solution would then be to exert greater AI or internet control over the population, with increased security in the form of barcodes, cashless societies, fingerprint entry, smart cars, and fake food. This means that the Rockefeller Foundation must control water sources for internet operation, information collection and storage, the processing of that information via AI or codes, the destruction of agriculture and industry, and must control the price of all businesses, since both businesses and people necessarily need water. The other part of the plan was to reduce the population. According to Judith Rodin, then president of the Rockefeller Foundation,promote well-being"Reducing the number of human beings" has been on the agenda of the Rockefeller Foundation since 1913. This date was recently confirmed by Weber Braga's articles in Culture Wars on the history of the Rockefellers in Brazil (November and December 2024 issues). All these plans can only be carried out by destroying and opening major dams to important cities, because when small businesses are destroyed, the population becomes more concentrated in groups controlled by large corporations. By targeting vulnerable ports and coastlines to flood them, elites like the Rockefellers quickly gain control of the seas, tourism, water, shipping and transportation, as well as AI development, not to mention agricultural production, industry, and the types of goods produced or entering a country.

It is interesting to note that one of the sites affected in Valencia was the housing complex built by Henry Ford's automobile company to house Ford employees. I spoke there to a man who rescued his friend at 3:00 a.m. and then lost his livelihood when the company's cars wouldn't start after the flood. It was Henry Ford who pointed out that Jews, through wars and propaganda, manage to seize control of the vital resources of society, water being one of the most essential. By targeting the coasts of the Gulf of Mexico, the Mediterranean, the Black Sea, Indonesia, Iceland, the Ring of Fire, and so on, oligarchs take control of the seas and transform nations into concentration camps or "police states." Moreover, Jews like George Soros exacerbate poverty and foment wars in Third World countries, leading to mass immigration of these populations to Europe, thus preparing the ground for a new type of wage slave that simultaneously undermines the European economy.

The Spanish crossed the seas and unified the world within their kingdom and with the Catholic religion 200 years before the English stole their maps. The crucial year of 1492 marks not only Christopher Columbus's voyage to America, but also the expulsion from Spain of the Jews who refused to practice Christian morality. The Spanish conquest of Tierra Firme, The expansion in America superimposed the will of God and the reign of the Catholic Monarchs.

What we have today is the triumph of the anti-Christian kingdom of the Jews thanks to their extraordinary financial resources acquired through theft and murder, but also thanks to the types of governments they put in place long ago in opposition to Catholic monarchs.

On her deathbed, the queen who had expanded and protected Spain was also concerned about the well-being of foreign races. Once Catholics abandon the true religion and the ideal of a Catholic monarchy, they find themselves defenseless against the seven-headed beast that rises from the sea, according to the Book of Revelation:And they blasphemed the God of heaven because of their pains and their wounds, and they did not repent of their deeds.»[109]From North Carolina

to Spain, the motto of the populations affected by the floods is "el pueblo salva el pueblo"(It is the people who save the people.) However, a headless body cannot act, just as a blocked irrigation system cannot irrigate a region, and blocked veins cannot support a heart that wants to beat. Such weaknesses allow enemies of humanity to rule over us."

History of Spain and Anti-Catholic Art

Back in Arévalo, Spain, where Queen Isabella grew up, where the castle she reclaimed and defended stands, where the art of bullfighting was born, where the presence of Saint Teresa blessed the water and made the fish incorruptible, and where I end this story, in line with the analysis by the Jewish-owned Netflix company on the Valencia floods, we have the latest art exhibition by Javier Lumbreras, “The Rain Doesn't Come from Heaven"(Rain does not come from the sky)," which he installed in the abandoned 12th-century parish of San Martin in Arévalo. Lumbreras, who hails from the "small town" of Arévalo, is now chairman of the board of the Art Fund Association in New York and heavily involved in the world of finance, estate planning, and alternative investments.

Javier Lumbreras could have used a number of other abandoned buildings to present his exhibition, and given the quality of his "art," he could have used a pigsty, but he chose to rent a Catholic church whose gilded Baroque altarpiece is intact. And the church he chose to rent is the one where Brother Juan Gil, the man who ransomed Miguel de Cervantes from slavery before he wrote... Don QuixoteIn this exhibition, Lumbreras satirizes the fact that it is no longer the sky that provides the rain. God has been surpassed. Lumbreras knows where the water comes from, because he lives among artists, art collectors, and art investors, who are the people who control propaganda and culture, as Dr. E. Michael Jones explains in The Dangers of Beauty: the Conflict Between Mimesis and Concupiscence in the Fine Arts ("The Dangers of Beauty: The Conflict Between Mimesis and Concupiosity in the Fine Arts"). In the same work, Dr. Jones proves that modern art is Jewish. From what I've been able to gather from the townspeople, the Lumbreras family had to leave for the United States after Lumbreras's father, a lawyer, was caught red-handed defrauding families in Arévalo of large sums of money, which the townspeople still remember. Consequently, Javier Lumbreras grew up in major cities in the United States and eventually married Lorena Pérez-Jácome, of Univisión, Telemundo, and Fox Latinoamerica. In addition to her position in the most influential media outlets in Latin America, Lorena is the daughter of a Mexican senator. Lumbreras's brother-in-law, Dionisio Pérez-Jácome Friscione, is heavily involved in the Mexican energy sector and is nicknamed "tijeras" (scissors) or something similar to describe his economic role within the Mexican government, now led by Claudia Sheinbaum (of communist and Jewish descent). Dionisio served as Secretary of Communications and Transportation under President Calderón and later became Mexico's ambassador to Canada.

Javier Lumbreras aligns his art exhibitions with Madrid's most important art fairs, known as ARCO, in order to attract groups of foreign investors to Arévalo to see his exhibitions, which change every six months. When I asked Lumbreras about the theme chosen for the period from September 2024 to March 2025,The Rain Doesn't Come from HeavenLumbreras explained to me that the theme had been chosen by his associate in the city, Aldones Nino, a Brazilian with degrees in history and philosophy who, according to Harvard University, specializes in thedecolonial thinkingWhat Nino means by "decolonial" is undoubtedly an "anti-Catholic" thought, because his mind is certainly colonized, and of his own free will.

Unsurprisingly, Nino chose not to use photos of the catastrophic floods in Brazil in the exhibition, despite the morbid nature of many of the other works. Studying the artworks, one might guess that Nino and Lumbreras would have been delighted to display photos of corpses floating in the water. Instead, he hung photos of an unusually romantic, muscular, tanned gay man with a fish the model had supposedly caught in Brazilian rivers. Just opposite the entrance is a collage of photos of chemical trails spelling out ominous messages such as "Boo!", "Goodbye" in foreign languages, and "Dream Death" in English. I will posit that "Metanoia" refers to the new civilization that will emerge after the

implementation of Agenda 2030. Nino obtained this exhibition through the Catholic doors of the parish by arguing that the exhibition was inspired by the incorruptible fish of Saint Teresa of Avila, which may be true, but not in the way we hope. He concealed his decadent intentions under the guise of religion and the sacred history of Arevalo. But the public is not fooled.

For the first of "The Rain Doesn't Come from HeavenLumbreras brought foreign investors to the city just in time for the heavy rains in Arévalo, but also a month before the DANA (National Anti-Corruption Agency) in Valencia. Like the Jews who returned to Spain and regained power after being expelled, Lumbreras's son, Javier, returned outwardly on good terms with the city, but then mocked its plight and that of the Catholic Church by placing blasphemous and vulgar artwork directly in front of the Virgin Mary, Saint Martin, and the saints, as well as on what remained of the altar. With the Brazilian's help, a work depicting the rain of debauchery was placed at the center of the exhibition, in front of the altar. The work represents a fountain of water from which everyone can drink freely, thanks to numerous red breasts. Next to the altar is a man who appears bloodied and dismembered, as aborted fetuses often are. The artist writes that he painted himself in his bathtub. Next to the centerpiece, two naked lesbians stand in the water. Beside the lesbians is a rusty metal boat, expressly made from scrap and expressly representing Noah's Ark, by Juan Jesús Villaverde. According to the descriptive plaque hanging on the wall, Villaverde promotes "alternative narrativesand new paradigms, particularly with regard to the idea of "heterosexual reproduction."

Villaverde forgets that widespread debauchery and homosexuality were the primary causes of the Flood. Villaverde's art, likely created with Lumbreras's assistance, is scattered throughout Arévalo, but especially within and around the monumental sites of Queen Isabella's castle. A work made from discarded materials prevents pilgrims from taking proper photographs of the castle's facade. Once this connection is made, it becomes clear that Lumbreras is there to destroy Catholic culture and history.

Lumbreras plans to extend his project to the fortified sections of the city and other abandoned parishes. The architectural plans for the buildings he hopes to construct are an eyesore among the royal ruins. This is an act of Jewish warfare, not art. Or should we say that Jewish art is an act of war?

It is a war because the palace that housed Queen Isabella, Servant of God, and his queen mother, and which was the only real attraction in the city due to its history and importance, was demolished to make way for more modern buildings, even though the official chronicler of Arévalo, Ricardo Sancho Guerra, and others tried to save it in 1975. Lumbreras and his family could breathe new life into the city by attracting pilgrims and tourists to its beauty and religion, as Guerra and the Ayuntamiento of Arévalo are doing: on December 13, the city crowned a statue of the queen with a magnificent crown and rang the city's bell towers for 15 minutes as part of a commemorative act celebrating the 550th anniversary of her proclamation as queen. And this, after days of conferences, music, exhibitions of her last testament and other acts of love to honor their Catholic queen who now watches over the Mother of God from heaven.

Instead, Javier Lumbreras literally covers the medieval architecture and holy places with trash and vulgarity, much like what is done in Madrid around the Royal Palace to distract from its grandeur. This is not art. One work in the choir of San Martín consists of cardboard boxes laid on their sides. It is war, for beneath the choir, muddy water flows from a pipe and is collected in the form of a disturbing creature that could easily commemorate the destruction of Valencia's businesses. In one of the chapels, a repulsive blue metallic demon scratches the wall in a frightening manner. The floor of another chapel is covered with plastic pipes filled with murky, colored water. The visible, bubbling movement of the dark water and the way the pipes are connected are reminiscent of human veins and Spanish rivers. Who has clogged Spain's irrigation systems? Who has clogged Spain's veins?

Israel, graphene, and a look back at the past

I would respond by pointing out that Israeli news sites have admitted that the Israelis were working on a Covid vaccine before the pandemic hit. These vaccines reportedly contain graphene, the main ingredient in Josep Hornet's lab experiments. Josep M. Hornet, an electrical and computer engineer from Barcelona, runs a lab at Northeastern University in Boston that is creating graphene-based nanotechnology to transform human veins into iPhone accessories. He may be related to Josep M. Benet i Hornet, a revolutionary figure in the theater and art world who died of Covid in 2020. All of Hornet's lab assistants are Chinese and hold Chinese university degrees. I would like to emphasize that, according to the Jewish JournalAn Israeli, Tal Zaks, led the development efforts of the Moderna vaccine in collaboration with Dr. Anthony Fauci and Pfizer-BioNTech[110]The Pfizer and Moderna vaccines both caused long blood clots to form in the veins of those who received them, and both weakened and killed men at an average rate 20% higher than that of women. Not to mention the American-Israeli (Jewish) Charles M. Lieber, a Harvard chemistry professor, who was caught collaborating in the creation of the virus in Wuhan, China.Lieber agreed to conduct research, publish articles, and file patents on behalf of Wuhan University of Technology in China in exchange for $50,000 per month.».[111]

Alongside the pipes, the art exhibit features a drinking water bottle filled with muddy orange water, similar to that which flooded Valencia. This artwork serves as a reminder that, from Valencia to Arévalo, Spaniards believed the Valencia floods were linked to control of the drinking water supply due to its cost. Others suggested that George Soros had planned to poison these same water sources.

Lumbreras's art exhibition is insulting because it blasphemes against God in the city of Queen Isabella, in a Catholic church, and in a city that is itself structurally beautiful thanks to Catholic culture, and this with the help of a Brazilian who admits to hating Spain. But above all, because no one can do anything there without seeing their life ruined. It is a conquered place. We can sit under a tree and weep like Hernán Cortés after his defeat in the Noche Triste. The only true work of art in Lumbreras's exhibition is the painting "The Sad Night" or "weThe Night of Sorrowswhich depicts the night Hernán Cortés, his fellow Spaniards, and their indigenous allies were driven out of Tenochtitlan while under attack by the Aztecs. In the painting, Cortés and his men cross the causeways that connected Tenochtitlan, the floating city on a lake, to the mainland. The Aztecs in the painting emerge from the water to attack. According to the painting's description in Lumbreras's art exhibition, the pagan cannibals won because they understoodchanges in water levels and the impact of rainfall, and used this knowledge to their advantage on the battlefield"I think Lumbreras' message on behalf of the elites is clear: the danger to the last vestiges of culture and Catholicism comes from the water that the Jews, servants of the coming Antichrist, are manipulating so that he can rule the new world empire in direct opposition to and suppression of the Spanish model represented by the reign of the Catholic Monarchs and the positive influence of the Spanish saints who founded glorious religious orders, such as Ignatius, Dominic and Teresa of Jesus."

Queen Isabel led the final advance of the Reconquest From 1482 to 1492, he not only rode with his troops into battle, but also cared for the wounded with his own hands and fasted on bread and water.[112]It is no coincidence that this same queen, who remembered the Native Americans on her deathbed, expelled the Jews for their practice of usury, among other evils. Queen Isabella is therefore truly the saint of our time, for she knew how to identify the enemies harmful to her government. She knew how to protect what was good and punish wrongdoing. She vowed to pursue this common good when she became queen. There are still courageous men to wage this battle. I saw them myself in Madrigal de las Altas Torres, where Queen Isabella was born and baptized. They came in great numbers, unarmed, during the feast of Saint Nicholas, the town's patron saint, to face bulls. Although the queen tried to reduce the carnage, she had permitted this sport because it helps maintain the habit of bravery and risk-taking among Spaniards. It was invigorating to see that the festival was organized by men risking their lives for the sheer joy of overcoming fear, death,

and nature. In this way, and in many others, the Catholic Monarchs forged a robust people who would do well to return to their Catholic monarchical roots. I hope that the Spanish people will respond to the good intentions of their Queen Isabella and defend their faith, that factor which unites them into an impressive force.

Before the anti-Christian globalization plan succeeds, I encourage a return to an earlier model. If we can establish that the world's most powerful governments are conspiring to destroy us and seize our property and businesses, perhaps it is time to submit our property, our person, and our businesses to someone who cares about our well-being and who is not only capable but also determined to recruit courageous young men to protect the dams before they are destroyed.

Queen Isabella of Castile, help us.

I would like to thank Casa Felipe, the best bar in all of Arévalo where I learned so much, my guides and teachers in Spain, and everyone who loves it.

CBS 17 reported that the Lure Lake dam had failed. CBS 17, "New footage: Damage to Lure Lake dam and flooding in S. Asheville," YouTube, September 28, 2024. https://www.youtube.com/watch?v=MEouxc4dazQ
Et
The Lure Lake Dam is located southeast of Asheville. 3000 residents were ordered to evacuate immediately. The dam was expected to break imminently. Structural engineers concluded that the dam was not imminent. The town was, in fact, stable. The dam lost its power supply. The 124-foot-high hydroelectric dam on the Broad River, 25 miles from Asheville, was built between 1925 and 2927 to generate electricity. Operators lost power when the dam eroded but began manually operating the floodgates. As of March 2023, it was in good condition.
